

Project Initialization and Planning Phase

Date	30 June 2026
Team ID	N/A
Project Title	Personalized Networking Assistant
Maximum Marks	5 Marks

Project Proposal (Proposed Solution) report

The Personalized Networking Assistant is an AI-powered application designed to help users communicate confidently during professional networking events. It generates personalized conversation starters based on user interests and event descriptions using Natural Language Processing (NLP). The application also provides fact-checking through the Wikipedia API, stores conversation history, and collects user feedback for continuous improvement.

Project Overview	
Objective	Develop an AI-powered networking assistant that generates personalized conversation starters, verifies facts, and helps users build confidence during professional networking events.
Scope	The project focuses on assisting students, professionals, and job seekers by integrating Groq LLM , FastAPI , Streamlit , Wikipedia API , and SQLite to provide intelligent networking assistance and conversation history management.
Problem Statement	
Description	Many students and professionals struggle to initiate meaningful conversations during networking events because they lack confidence, relevant discussion topics, and quick access to reliable information.
Impact	This results in missed networking opportunities, reduced confidence, ineffective professional communication, and fewer career connections.
Proposed Solution	

Approach	Develop an AI-powered application that accepts user interests, background, profession, and event details. The system uses the Groq API to generate personalized conversation starters, self-introductions, and networking tips. It verifies factual information using the Wikipedia API and stores conversation history in a SQLite(networking.db) database through the FastAPI backend.
Key Features	• AI-generated personalized conversation starters • Personalized self-introduction generation • Smart networking tips • Event-specific conversation suggestions • Fact verification using Wikipedia API • Conversation history stored in SQLite (networking.db) • Interactive Streamlit interface • High-performance FastAPI backend.

Resource Requirements

Resource Type	Description	Specification/Allocation
Hardware		
Computing Resources	CPU for AI model execution	Intel i5/Ryzen 5 or above
Memory	RAM 8 GB	8 GB
Storage	Project files, models and logs	20 GB SSD
Software		
Frameworks	Backend & Frontend	FastAPI, Streamlit
Libraries	AI & Backend	Groq API SDK, Requests, HTTPX, BeautifulSoup4, Pydantic, python-dotenv, PyTest

Development Environment	IDE	Visual Studio Code
Data		
Data	Resource Type Description Specification Data	SQLite (networking.db), Wikipedia API responses
